

# PEDALS UP

## Problem statement

Modern blockchain applications require seamless wallet connectivity, but integrating different wallet providers into React applications remains fragmented and complex. Developers often struggle with inconsistent APIs, authentication flows, and cross-platform compatibility issues.

## Challenge

**Create a browser extension wallet that:**

1. Implements a standardized interface for connecting to any React application
2. Supports multiple blockchain networks (e.g., Ethereum, Solana, or others of your choice)
3. Provides a simple, developer-friendly API for React applications to integrate with
4. Handles secure key management and transaction signing
5. Offers a clean user interface for wallet management and transaction approvals

## Requirements

The extension should work across major browsers

- Integration into React applications should require minimal configuration
- Security best practices must be implemented
- The wallet should support at least two blockchain networks
- Demonstrate the wallet's functionality with a simple React application

This challenge will test your skills in browser extension development, React, blockchain integration, and security practices while creating a tool that solves a real developer pain point.
